Slim 170 in the Comfy version (on the left) and the Easy version (below)

A new generation is born

The Slim range is being renewed, with new models and innovative technological solutions. The Slim 170 model will be launched at the Caravan Salon, followed by the Slim 70 and Slim 90

Words Renato Antonini

Giorgio Biggiogero

Last year, Vitrifrigo worked intensively on refrigeration solutions dedicated to the campervan and minivan segment. It has now begun focusing on other market segments as well, turning its attention to the Slim range.

"2026 is a turning point for Vitrifrigo," says Giorgio Biggiogero, Sales & Marketing Director at Vitrifrigo, *"because we are introducing new products that allow us to approach the market with a broad offering, with refrigerators ranging from 30 to 260 litres. This is an offering capable of providing solutions also for those vehicle types for which we previously did not have competitive proposals. A key element of our range will be the Slim series, launched in 2020 and now undergoing a renewal. At the Caravan Salon we will present the Slim 170 model, which will allow us to move beyond the camper van segment and provide RV manufacturers with a high-level product suitable for motorhomes."*

The new Slim 170

The new Slim 170 compressor refrigerator is the "right size" for a significant part of European motorhome production. In essence, it represents an excellent compromise between internal volume and external dimensions. It is worth noting that this refrigeration unit introduces solutions that are new to the Vitrifrigo range.

"The Slim 170 is not merely an addition to the Slim range," explains Giorgio Biggiogero, *"but also introduces innovative technical solutions, such as the compressor design and airflow management, which will later be applied to other Vitrifrigo products."*

Ease of installation is important for RV manufacturers, and this is ensured by the possibility of total recess installation of the appliance, with a plug-and-play installation concept. The integrated ventilation grille is positioned in the lower part of the refrigerator and is designed to automatically ventilate the cooling unit thanks to a specific air duct. Its low position also has the advantage of reducing the noise and heat perceived by those living on board. The Vitrifrigo Slim 170 has a total volume of 160 litres and features an internal 28-litre freezer compartment: Tropical Class unit, three-star rating, with the freezer compartment

DP 260

reaching -18°C. Two front door colours are available: Black and White Grey. Two versions of the refrigerator are also planned, according to the layout of the internal compartment.
The Slim 170 Comfy model features a large 31-litre internal drawer positioned in the lower section, where drinks or food can be stored separately. The Slim 170 Easy model, on the other hand, offers a simplified internal solution, with an 11-litre fruit and vegetable compartment in the lower section.
In all cases, the Slim 170 is equipped with both Night Mode, for quiet night-time operation with low energy consumption, and Turbo Mode, for when the temperature of the refrigerator compartment needs to be lowered quickly.

Slim 70 and Slim 90

Vitrifrigo has announced the forthcoming launch of two further models in the Slim range, namely the Slim 70 and Slim 90. Their arrival is scheduled for mid-2027. They adopt many of the solutions found on the Slim 170, such as lower ventilation, but are more compact refrigerators designed for installation in vehicles where space optimisation is essential. Two versions will be available: one with a front-hinged door and one with drawer opening. The latter solution allows for a double locking system, at the top and bottom, providing greater safety while travelling. The Slim 70, with a volume of 70 litres and a 6-8 litre freezer compartment, is intended for floor-level installation beneath the worktop. The Slim 90, on the other hand, with a 90-litre volume and a 10-12 litre freezer cell, can also be installed in the upper section of the furniture.

The large DP 260

Everything is also ready for the market introduction of the DP 260 model, a large-capacity compressor refrigerator with high-end features and a total volume of 216 litres.
"The DP 260 is a large, 'no-compromise' refrigerator," says Giorgio Biggiogero, *"capable of delivering extremely high refrigeration performance. It is dedicated to the North American and Australian markets."*
This is a double-door refrigerator, with a 160-litre refrigerator compartment and a 56-litre freezer compartment. It is available with either hinged-door or drawer opening. It features a new horizontally developed control panel positioned in the upper section. It can operate in both Night Mode and Turbo Mode, and can also be controlled via a smartphone app.

New electronics, improved control

With the renewal of the Slim range, Vitrifrigo is also introducing important innovations developed to make its refrigerators more efficient, while also bringing the brand closer to the end user.

- *Operation even in the event of faults*

Thanks to an ambient temperature sensor positioned inside the suction channel, the system is able to detect the internal temperature of the vehicle at all times. Based on a proprietary algorithm, the refrigerator's operation automatically adapts to external conditions, adjusting the compressor speed and condenser ventilation. Although with lower precision, correct operation of the Slim range refrigerators is also ensured in the event of a fault in the internal temperature sensor.

- *Control via app*

The refrigerator can be controlled from a smartphone using the Vitrifrigo app. All the main data are displayed on a single screen. Special functions – switch-off, Night Mode and Turbo Mode – can also be scheduled to activate after a set number of hours.

- *Service*

All detected faults are displayed via the app. Fault notifications are sent directly to the Vitrifrigo assistance service. Service Mode allows the Vitrifrigo service network to interact fully with the appliance.
